
Prajit Research Website Reference

Every page, every menu item, all the text on the site, and an honest account of what works today and what does not.

PREPARED 15 SEPTEMBER 2026

FOR RAHUL ASANIKAR AND ABHIJIT KULKARNI

DOMAIN: PRAJITRESEARCH.COM

STATUS: BUILT AND CONNECTED TO ITS DATABASE; AWAITING DNS

Contents

- 01 Where the site stands today

- 02 What works and what does not

- 03 Site map — every menu item and what is inside

- 04 The public pages, word for word

- 05 The six sample writeups, in full

- 06 The admin area, screen by screen

- 07 What is left to do

01 · Where the site stands today

The website is finished and connected to a live database. Three things remain outside the website itself: the domain, the email sender, and the real content.

The parts and who holds them

PART	WHAT IT DOES	WHERE IT LIVES
The website	Everything a visitor sees and clicks	Four files in the GitHub repository <code>rujutaasanikar/prajit-research</code>
The database	Stores writeups, member accounts, view counts, uploaded documents; decides who is allowed to read what	Supabase project PrajitResearch (free plan, East US), owned by <code>ruju25a@gmail.com</code>
The address	<code>prajitresearch.com</code>	GoDaddy — DNS records not yet changed

Who can do what

PERSON	SEES
Guest (no account)	The landing page, the library list, every writeup summary, and the full text of writeups marked <i>Free</i> . The disclaimer and copyright pages.
Member (free account)	Everything above, plus the full text of writeups marked <i>Member</i> , and any document attached to them.
Subscriber	Everything, including writeups marked <i>Subscriber</i> and their attached models.
Admin	Everything, plus the Research desk: add, edit, publish and delete writeups; see view counts; change any reader's access level; approve or decline access requests. Only two email addresses are admins: <code>ruju25a@gmail.com</code> and <code>prajitresearch@gmail.com</code> .

How the gate is enforced. The text of a Member or Subscriber writeup is never sent to a browser that is not entitled to it — it is withheld by the database, not hidden by the page. Someone who opens the page source of a gated writeup as a guest finds the summary and nothing more. This was tested with more than forty automated checks covering guests, members, subscribers and admins.

02 · What works and what does not

Works today

FEATURE	STATUS	DETAIL
Landing page	Working	Hero, four statistics, Philosophy, Process, latest four writeups, three access tiers, About.
Research library	Working	All published writeups, newest first. Filter by type, search by title or sector.
Writeup pages	Working	Full text for entitled readers; summary plus an invitation for everyone else. Shows date, sector, type, reading time, version number, access level.
Sign up / sign in	Working	One flow: enter an email, receive a link, click it. First-time visitors get a free Member account automatically. No passwords exist, so there is no "forgot password" to fail.
Account page	Working	Reader can see their access level and change their own name and firm — nothing else.
Admin — writeups	Working	Create, edit, publish, unpublish, delete. Attach a PDF or spreadsheet. Set the access level per writeup. Drafts are invisible to readers.
Admin — view counts	Working	Per writeup: all-time opens, opens in the last seven days, and how many distinct signed-in readers.
Admin — members	Working	Every account listed; change anyone between Member and Subscriber.
Admin — requests	Working	Requests from the public form arrive here; approve or decline. Approving upgrades that person's account, and applies automatically if they sign up later.
Disclaimer and Copyright	Working	Full pages, linked in the footer and under every writeup.
Phones and tablets	Working	Tested down to 400 pixels wide; no sideways scrolling on any page.
Dark mode	Working	Follows the reader's own device setting.

Not built yet — deliberately

FEATURE	STATUS	WHAT HAPPENS INSTEAD
Card payments	Not built	No checkout on the site. A reader requests Subscriber access; you take payment however you like (invoice, transfer, a payment link) and then switch them to Subscriber in the admin. Automated checkout can be added later.
Email alerts to readers	Not built	New writeups are not emailed out. The Member tier currently promises this in the copy — either build it before launch or soften that line.
Search engine listing	Pending	Works once the domain is live; nothing to do.

Watermarked downloads	Not built	Attached documents are private to entitled readers but carry no per-reader watermark.
-----------------------	-----------	---

Comments, forums, reader profiles	Not built	Out of scope.
-----------------------------------	-----------	---------------

Blocked on something outside the website

ITEM	STATUS	WHAT IS NEEDED
prajitresearch.com	Blocked	Four A records and one CNAME at GoDaddy. Needs the account verification code from Abhijit. Until then the site is reachable only at its GitHub address.
Sign-in emails at volume	Blocked	Supabase's built-in sender is limited to a few messages an hour — fine for testing, not for readers. Connect a free sender (Resend or Brevo) under Authentication → SMTP Settings. Ten minutes.
Real writeups	Waiting	The six in the library are samples written to demonstrate the design. They describe no real company. Replace them before launch.
Four statistics, founder bio, pricing	Waiting	Placeholders. See section 04 for the exact wording to replace.
Legal review	Waiting	Counsel should read the Disclaimer and Copyright pages once. One question worth asking: where are paying readers located, and does selling research there trigger any registration requirement.

03 · Site map

The menu at the top of every page:

MENU ITEM	GOES TO	WHAT IS THERE
Prajit Research (top left)	Home	The landing page.
Research	The library	Every published writeup, with a type filter and a search box.
Philosophy	Home, Philosophy section	Three beliefs: primary sources only; every thesis has a kill condition; time is the edge.
Process	Home, Process section	The six numbered steps, each with the output it produces.
About	Home, About section	Independence statement and founder biography.
Sign in / Account	Sign-in page, or the account page once signed in	Email-link sign-in. Once signed in the same menu item reads "Account".
Admin	The research desk	Only appears for the two admin accounts. Four tabs: Overview, Writeups, Members, Requests.
Request access (gold button)	The request form	Name, email, firm, which level, and a free-text note.

In the footer of every page: Research · Philosophy · Process · About · Request access · Sign in · Disclaimer · Copyright, plus the standing legal note and the copyright line.

ESTABLISHED

PHILOSOPHY

What we believe the edge is

We read what the market has stopped reading. The edge is not information — it is the willingness to sit with a filing longer than anyone else, and the discipline to write down, in advance, what would make us sell.

Primary sources only

Every number in a writeup traces to a filing, a transcript, or a model we built. We do not cite sell-side targets, and we do not repeat consensus we have not reconstructed.

Every thesis has a kill condition

Before a note is published it carries the specific, observable event that would falsify it. When that event occurs, the note is updated — and the position is exited — whether or not the price has moved.

Time is the edge

We underwrite for three to five years, which lets us own businesses through the quarters in which nobody else wants to. Patience is not a slogan here; it is the entire model.

PROCESS

Six steps, always in order

The same six steps, in the same order, for every name. The sequence is the product.

Screen

A quantitative pass for businesses with durable returns on capital, sensible balance sheets, and an ownership structure that rewards patience. The screen removes names; it never adds conviction.

Read

Ten years of filings, proxies, and transcripts, in order. We are looking for the year management stopped explaining something.

Model

A unit-economics model built from the operating drivers up, not a revenue line extrapolated forward. Scenarios are weighted, and the bear case is written first.

Write

The writeup states the thesis in one paragraph, the valuation in one table, and the kill condition in one sentence. If any of the three cannot be written plainly, the note is not ready.

Publish

Notes go to subscribers first, then members, then — for selected pieces — the public library. Every note carries a disclosure of any position held.

Revisit

Each quarter, and on any kill-condition event, the note is updated. When we were wrong, the post-mortem is published with the same prominence as the original.

A price target tells you what we hope. A kill condition tells you what we will do. Every writeup we publish carries one sentence — observable, dated where possible, and independent of the share price — that describes the event that would prove the thesis wrong.

The discipline sounds obvious. It is rarely practised, because it forces the analyst to argue against the note before it is written. That is exactly the point: the kill condition is the bear case reduced to something we can check each quarter without re-litigating the whole thesis.

What a good kill condition looks like

In practice, a good kill condition is specific to the business model.

- For a distributor: two consecutive quarters of gross-margin compression while volume grows.
- For a bank: a deposit beta above the level the model assumed at the top of the cycle.

— Never: "the stock falls 20%".

When a kill condition triggers, two things happen on the same day: the note is updated, and any position is exited. The post-mortem is then published with the same prominence as the initiation. Readers should be able to judge us on our misses as easily as on our hits.

We initiated on the specialty lines in early 2025 on the view that hard-market pricing had a longer tail than the market assumed. The direction was right. The duration was not, and the kill condition — a second consecutive quarter of rate decreases in the core lines — triggered in the third quarter.

The error was one of extrapolation. Our model held retention flat while pricing softened, which is the one combination the cycle rarely delivers. When capacity returned, both moved at once.

The fix was structural rather than cosmetic: the model now links retention to rate change with a lag, and the bear case is required to include a capacity-return scenario for any name whose thesis rests on pricing. It is a more pessimistic model, and a better one.

We remain interested in the space at a different point in the cycle. The note stays in the library as published, with this post-mortem attached, because the original reasoning is the only honest record of what we believed and why.

Industrial distribution is usually described as a scale business. It is not, or at least not primarily. The economics are set by route density: revenue per delivery stop, stops per route, and the gross margin those stops carry. A large distributor with thin density earns less on capital than a regional one with dense routes.

This matters because scale is visible in the income statement and density is not. To find it, we rebuild the branch footprint from filings and count stops per route where the company discloses enough to do so.

The three traits

The names that pass that screen share three traits:

— Private-label penetration above a threshold.

- A branch-manager incentive tied to local return on assets rather than revenue.
- A working-capital cycle that shortens as the branch matures.

Each is disclosed somewhere; none is headlined.

Valuation follows from the density model rather than from a peer multiple. We show the base, bear, and bull cases for two illustrative footprints, and the kill condition for each: a sustained decline in gross profit per stop while the branch count grows.

WRITEUP

Signed in as Demo Subscriber

Every regional bank claims a low-cost deposit franchise. The cycle just ended was the first real test in fifteen years, and the results are now in the call reports. Our initiation ranks the franchises by the deposit beta they

actually realised, not the one they guided to.

The gap between guided and realised beta is the single most useful number in the sector today, because it reveals how much of the "core" deposit base was rate-insensitive in fact rather than in management's description.

From there the note rebuilds net interest income on a reset funding cost, stresses the securities book at two rate paths, and sets a kill condition per name tied to non-interest-bearing deposit mix rather than to earnings.

The full initiation includes the model, the ranking table, and the disclosure of positions held.

Hospital outsourcing: margin recovery is a volume story

Labour cost gets the headlines; contract density and case mix decide the margin.

PUBLISHED

Jul 1, 2026

SECTOR

Healthcare

TYPE

Initiation

READ TIME

27 min

VERSION

v1

ACCESS

MEMBER

WRITEUP

Signed in as Demo Subscriber

The consensus view on hospital outsourcing is that margins recover when contract labour normalises. That is half right. Labour is the largest cost, but the margin is decided by contract density — how many service lines the outsourcer runs inside a single facility — and by case mix.

Density is what turns a fixed on-site cost into a variable one. A single-line contract carries the full overhead of a site; a third line at the same site carries almost none.

The note sets out how to read density from segment disclosures, why the incumbents' reported "same-site growth" understates it, and what a normalised margin looks like once density is modelled explicitly.

Kill condition: two consecutive quarters in which new-contract wins are majority single-line, which would indicate the density thesis is not being executed.

Memory pricing and the discipline nobody expects to last

An update to the initiation: the supply response is slower than our bear case assumed, and the kill condition has not triggered.

PUBLISHED

Jun 12, 2026

SECTOR

Semiconductors

TYPE

Update

READ TIME

11 min

VERSION

v2

ACCESS

SUBSCRIBER

WRITEUP

Signed in as Demo Subscriber

This update revisits the memory initiation against two quarters of data. The central question was whether capital discipline would hold once pricing recovered; the market assumed it would not, and our bear case

agreed.

So far the supply response has been slower than either expected. Capacity announcements have lagged pricing by more than a full cycle's worth of historical precedent.

We do not raise the thesis on the strength of two quarters. We do note that the kill condition — a specific capacity-addition threshold — has not triggered, and we update the scenario weights accordingly.

Positions held are disclosed in full below. The model is updated in the subscriber download.

Note on the numbers shown above. The view counts and member names in this document come from the demonstration data, not from real readers. On the live site these tables start empty and fill as people visit.

07 · What is left to do

#	TASK	WHO	TIME
1	Get the GoDaddy verification code and add the DNS records (four A records for @, one CNAME for www pointing to rujutaasanikar.github.io)	Rahul + Abhijit	10 min
2	On GitHub: Settings → Pages → wait for "DNS check successful", then tick Enforce HTTPS	Rahul	5 min + waiting
3	Connect a free email sender in Supabase (Authentication → SMTP Settings)	Rahul	10 min
4	Sign in once with an admin email to confirm the admin area opens	Both	2 min
5	Delete the six sample writeups; add the real ones	Whoever writes them	—
6	Send the four statistics, the founder biography and the subscriber price	Rahul	—
7	Counsel reads the Disclaimer and Copyright pages	Counsel	—
8	Invite Abhijit to the Supabase project and the GitHub repository	Rahul	5 min
9	Decide whether to build email alerts for new writeups, or soften that promise in the Member tier	Both	—

Nothing in this list costs money. The Supabase and GitHub plans in use are free, and the email senders suggested have free tiers that cover a small readership.
